A Simple GRASP (grasp.nhlbi.nih.gov) API based on SQLAlchemy and Pandas.

Author	Michael D Dacre < mike.dacre@gmail.com >
License	MIT License, made at Stanford, use as you wish.
Version	0.2.0b

For an introduction see the [github readme](#)

For table information see the [wiki](#)

SUBMODULES

1.1 grasp.tables

GRASP table descriptions in SQLAlchemy ORM.

These tables do not exist in the GRASP data, which is a single flat file. By separating the data into these tables querying is much more efficient.

This submodule should only be used for querying.

```
class grasp.tables.SNP (**kwargs)
    Bases: sqlalchemy.ext.declarative.api.Base
    An SQLAlchemy Table for GRASP SNPs.
    Study and phenotype information are pushed to other tables to minimize table size and make querying easier.
    Table Name: snps
    Columns: Described in the columns attribute

    int
        The ID number of the SNP, usually the NHLBIkey

    str
        SNP location expressed as 'chr:pos'

    hvg_ids
        A list of HGVS IDs for this SNP

    columns
        A dictionary of all columns 'column_name'=>('type', 'desc')

    ConservPredTFBS
    CreationDate
    Eqt1MethMetabStudy
    HUPfield
    HumanEnhancer
    InGene
    InLincRNA
    InMiRNA
    InMiRNABS
    LSSNP
```

`LastCurationDate`

`NHLBIkey`

`NearestGene`

`ORegAnno`

`PolyPhen2`

`RNAedit`

`SIFT`

`UniProt`

`chrom`

`columns = OrderedDict([('id', ('BigInteger', 'NHLBIkey')), ('snpid', ('String', 'SNPid')), ('chrom', ('String', 'chr')), ('p`
A description of all columns in this table.

`dbSNPClinStatus`

`dbSNPMAF`

`dbSNPfxn`

`dbSNPinfo`

`dbSNPvalidation`

`display_columns` (*display_as='table', write=False*)

Return all columns in the table nicely formatted.

Display choices: table: A formatted grid-like table tab: A tab delimited non-formatted version of table
list: A string list of column names

Parameters

- **display_as** – {table,tab,list}
- **write** – If true, print output to console, otherwise return string.

Returns A formatted string or None

`get_columns` (*return_as='list'*)

Return all columns in the table nicely formatted.

Display choices: list: A python list of column names dictionary: A python dictionary of name=>desc
long_dict: A python dictionary of name=>(type, desc)

Parameters **return_as** – {table,tab,list,dictionary,long_dict,id_dict}

Returns A list or dictionary

`get_variant_info` (*fields='dbSNP', pandas=True*)

Use the myvariant API to get info about this SNP.

Note that this service can be very slow. It will be faster to query multiple SNPs.

Parameters

- **fields** – Choose fields to display from: docs.myvariant.info/en/latest/doc/data.html#available-fields Good choices are 'dbSNP', 'clinvar', or 'gwassnps' Can also use 'grasp' to get a different version of this info.

- **pandas** – Return a dataframe instead of dictionary.

Returns A dictionary or a dataframe.

hvggs_ids

The HVGS ID from myvariant.

id

paper_loc

phenotype_cats

phenotype_desc

population

population_id

pos

pval

snp_loc

Return a simple string containing the SNP location.

snpid

study

study_id

study_snpid

class grasp.tables.**Phenotype** (**kwargs)

Bases: sqlalchemy.ext.declarative.api.Base

An SQLAlchemy table to store the primary phenotype.

Table Name: phenos

Columns: phenotype: The string phenotype from the GRASP DB, unique. alias: A short representation of the phenotype, not unique. studies: A link to the studies table.

int

The ID number.

str

The name of the phenotype.

alias

id

phenotype

studies

class grasp.tables.**PhenoCats** (**kwargs)

Bases: sqlalchemy.ext.declarative.api.Base

An SQLAlchemy table to store the lists of phenotype categories.

Table Name: pheno_cats

Columns: category: The category from the grasp database, unique. alias: An easy to use alias of the category, not unique. snps: A link to all SNPs in this category. studies: A link to all studies in this category.

```

int
    The PhenoCat ID
str
    The category name
alias
category
id
snps
studies

```

class `grasp.tables.Platform(platform)`
 Bases: `sqlalchemy.ext.declarative.api.Base`
 An SQLAlchemy table to store the platform information.

Table Name: platforms

Columns: platform: The name of the platform from GRASP. studies: A link to all studies using this platform.

```

int
    The ID number of this platform
str
    The name of the platform
id
platform
studies

```

class `grasp.tables.Population(population)`
 Bases: `sqlalchemy.ext.declarative.api.Base`
 An SQLAlchemy table to store the platform information.

Table Name: populations

Columns: population: The name of the population. studies: A link to all studies in this population. snps: A link to all SNPs in this populations.

```

int
    Population ID number
str
    The name of the population
id
population

```

1.2 grasp.db

Functions for managing the GRASP database.

`get_session()` is used everywhere in the module to create a connection to the database. `initialize_database()` is used to build the database from the GRASP file. It takes about an hour 90 minutes to run and will overwrite any existing database.

`grasp.db.get_session(echo=False)`

Return a session and engine, uses config file.

Parameters `echo` – Echo all SQL to the console.

Returns

A SQLAlchemy session and engine object corresponding to the grasp database for use in querying.

Return type session, engine

`grasp.db.initialize_database(study_file, grasp_file, commit_every=250000, progress=False)`

Create the database quickly.

Study_file Tab delimited GRASP study file, available here:
github.com/MikeDacre/grasp/blob/master/grasp_studies.txt

Grasp_file Tab delimited GRASP file.

Commit_every How many rows to go through before committing to disk.

Progress Display a progress bar (db length hard coded).

1.3 grasp.config

Manage a persistent configuration for the database.

`grasp.config.config = <configparser.ConfigParser object>`

A globally accessible ConfigParser object, initialized with CONFIG_FILE.

`grasp.config.CONFIG_FILE = '/Users/dacre/.grasp'`

The PATH to the config file.

`grasp.config.init_config(db_type, db_file='', db_host='', db_user='', db_pass='')`

Create an initial config file.

Parameters

- **db_type** – 'sqlite/mysql/postgresql'
- **db_file** – PATH to sqlite database file
- **db_host** – Hostname for mysql or postgresql server
- **db_user** – Username for mysql or postgresql server
- **db_pass** – Password for mysql or postgresql server (not secure)

Returns NoneType

Return type None

`grasp.config.init_config_interactive()`

Interact with the user to create a new config.

Uses readline autocompletion to make setup easier.

`grasp.config.write_config()`

Write the current config to CONFIG_FILE.

1.4 grasp.query

A mix of functions to make querying the database and analyzing the results faster.

```
grasp.query.get_studies(primary_phenotype=None, pheno_cats=None, pheno_cats_alias=None,
                        primary_pop=None, has_disc_pop=None, has_rep_pop=None,
                        only_disc_pop=None, only_rep_pop=None, query=False, count=False,
                        dictionary=False, pandas=False)
```

Return a list of studies filtered by phenotype and population.

There are two ways to query both phenotype and population.

Phenotype: GRASP provides a ‘primary phenotype’ for each study, which are fairly poorly curated. They also provide a list of phenotype categories, which are well curated. The problem with the categories is that there are multiple per study and some are too general to be useful. If using categories be sure to post filter the study list.

Note: I have made a list of aliases for the phenotype categories to make them easier to type. Use `pheno_cats_alias` for that.

Population: Each study has a primary population (list available with ‘get_populations’) but some studies also have other populations in the cohort. GRASP indexes all population counts, so those can be used to query also. To query these use `has_` or `only_` (exclusive) parameters, you can query either discovery populations or replication populations. Note that you cannot provide both `has_` and `only_` parameters for the same population type.

For doing population specific analyses most of the time you will want the `excl_disc_pop` query.

Argument Description: Phenotype Arguments are ‘primary_phenotype’, ‘pheno_cats’, and ‘pheno_cats_alias’.

Only provide one of `pheno_cats` or `pheno_cats_alias`

Population Arguments are `primary_pop`, `has_disc_pop`, `has_rep_pop`, `only_disc_pop`, `only_rep_pop`.

`primary_pop` is a simple argument, the others use bitwise flags for lookup.

The easiest way to use the following parameters is with the `_ref.PopFlag` object. It uses py-flags. For example:

```
pops = _ref.PopFlag.eur | _ref.PopFlag.afr
```

In addition you can provide a list of strings corresponding to `PopFlag` attributes.

Note: the `only_` parameters work as ANDs, not ORs. So `only_disc_pop='eur|afr'` will return those studies that have BOTH european and african discovery populations, but no other discovery populations. On the other hand, `has_` works as an OR, and will return any study with any of the specified populations.

Parameters

- **primary_phenotype** – Phenotype of interest, string or list of strings.
- **pheno_cats** – Phenotype category of interest.
- **pheno_cats_alias** – Phenotype category of interest.
- **primary_pop** – Query the primary population, string or list of strings.
- **has_disc_pop** – Return all studies with these discovery populations
- **has_rep_pop** – Return all studies with these replication populations
- **only_disc_pop** – Return all studies with ONLY these discovery populations

- **only_rep_pop** – Return all studies with ONLY these replication populations
- **query** – Return the query instead of the list of study objects.
- **count** – Return a count of the number of studies.
- **dictionary** – Return a dictionary of title->id for filtering.
- **pandas** – Return a dataframe of study information instead of the list.

Returns A list of study objects, a query, or a dataframe.

`grasp.query.get_snps(studies, pandas=True)`

Return a list of SNPs in a single population in a single phenotype.

Studies A list of studies.

Pandas Return a dataframe instead of a list of SNP objects.

Returns Either a DataFrame or list of SNP objects.

`grasp.query.get_variant_info(snp_list, fields='db SNP', pandas=True)`

Get variant info for a list of SNPs.

Parameters

- **snp_list** – A list of SNP objects or SNP rsIDs
- **fields** – Choose fields to display from: [‘docs.myvariant.info/en/latest/doc/data.html#available-fields’](https://docs.myvariant.info/en/latest/doc/data.html#available-fields) Good choices are ‘db SNP’, ‘clinvar’, or ‘gwas SNPs’ Can also use ‘grasp’ to get a different version of this info.
- **pandas** – Return a dataframe instead of dictionary.

Returns A dictionary or a dataframe.

`grasp.query.find_intersecting_phenotypes(primary_pops=None, pop_flags=None, check='cat', pop_type='disc', exclusive=False, list_only=False)`

Return a list of phenotypes that are present in all populations.

Can only provide one of primary_pops or pop_flags. pop_flags does a bitwise lookup, primary_pops queries the primary string only.

By default this function returns a list of phenotype categories, if you want to check primary phenotypes instead, provide check='primary'.

Parameters

- **primary_pops** – A string or list of strings corresponding to the *tables.Study.phenotype* column
- **pop_flags** – A *ref.PopFlag* object or list of objects.
- **check** – cat/primary either check categories or primary phenos.
- **pop_type** – disc/rep Use with pop_flags only, check either discovery or replication populations.
- **exclusive** – Use with pop_flags only, do an exclusive rather than inclusion population search
- **list_only** – Return a list of names only, rather than a list of objects

Returns A list of *table.Phenotype* or *table.PhenoCat* objects, or a list of names if *list_only* is specified.

```
grasp.query.collapse_dataframe(df, mechanism='median', pvalue_filter=None, protected_columns=None)
```

Collapse a dataframe by chrom:location from get_snps.

Will use the mechanism defined by 'mechanism' to collapse a dataframe to one indexed by 'chrom:location' with pvalue and count only.

This function is agnostic to all dataframe columns other than:

```
['chrom', 'pos', 'snpid', 'pval']
```

All other columns are collapsed into a comma separated list, a string. 'chrom' and 'pos' are merged to become the new colon-separated index, snpid is maintained, and pval is merged using the function in 'mechanism'.

Parameters

- **df** – A pandas dataframe, must have 'chrom', 'pos', 'snpid', and 'pval' columns.
- **mechanism** – A numpy statistical function to use to collapse the pvalue, median or mean are the common ones.
- **pvalue_filter** – After collapsing the dataframe, filter to only include pvalues less than this cutoff.
- **protected_columns** – A list of column names that will be maintained as is, although all duplicates will be dropped (randomly). Only makes sense for columns that are identical for all studies of the same SNP.

Returns

Indexed by chr:pos, contains flattened pvalue column, and all original columns as a comma-separated list. Additionally contains a count and stddev (of pvalues) column. stddev is nan if count is 1.

Return type DataFrame

```
grasp.query.intersect_overlapping_series(series1, series2, names=None, stats=True, plot=False)
```

Plot all SNPs that overlap between two pvalue series.

Parameters

- **series** – A pandas series object
- **names** – A list of two names to use for the resultant dataframes
- **stats** – Print some stats on the intersection
- **plot** – Plot the resulting intersection

Returns with the two series as columns

Return type DataFrame

1.5 grasp.info

Little functions to pretty print column lists and category info.

get_{phenotypes,phenotype_categories,populations} all display a dump of the whole database.

get_population_flags displays available flags from PopFlag.

display_{study,snp}_columns displays a list of available columns in those two tables as a formatted string.

`get_{study,snp}_columns` return a list of available columns in those two tables as python objects.

`grasp.info.display_snp_columns (display_as='table', write=False)`

Return all columns in the SNP table as a string.

Display choices: table: A formatted grid-like table tab: A tab delimited non-formatted version of table list: A string list of column names

Parameters

- **display_as** – {table,tab,list}
- **write** – If true, print output to console, otherwise return string.

Returns A formatted string or None

`grasp.info.display_study_columns (display_as='table', write=False)`

Return all columns in the Study table as a string.

Display choices: table: A formatted grid-like table tab: A tab delimited non-formatted version of table list: A string list of column names

Parameters

- **display_as** – {table,tab,list}
- **write** – If true, print output to console, otherwise return string.

Returns A formatted string or None

`grasp.info.get_phenotype_categories (list_only=False, dictionary=False, table=False)`

Return all phenotype categories from the PhenoCats table.

List_only Return a simple text list instead of a list of Phenotype objects.

Dictionary Return a dictionary of phenotype=>ID

Table Return a pretty table for printing.

`grasp.info.get_phenotypes (list_only=False, dictionary=False, table=False)`

Return all phenotypes from the Phenotype table.

List_only Return a simple text list instead of a list of Phenotype objects.

Dictionary Return a dictionary of phenotype=>ID

Table Return a pretty table for printing.

`grasp.info.get_population_flags (list_only=False, dictionary=False, table=False)`

Return all population flags available in the PopFlags class.

List_only Return a simple text list instead of a list of Phenotype objects.

Dictionary Return a dictionary of population=>ID

Table Return a pretty table for printing.

`grasp.info.get_populations (list_only=False, dictionary=False, table=False)`

Return all populatons from the Population table.

List_only Return a simple text list instead of a list of Phenotype objects.

Dictionary Return a dictionary of population=>ID

Table Return a pretty table for printing.

`grasp.info.get_snp_columns (return_as='list')`

Return all columns in the SNP table.

Display choices: list: A python list of column names dictionary: A python dictionary of name=>desc long_dict: A python dictionary of name=>(type, desc)

Parameters `return_as` – {table,tab,list,dictionary,long_dict,id_dict}

Returns A list or dictionary

`grasp.info.get_study_columns (return_as='list')`

Return all columns in the SNP table.

Display choices: list: A python list of column names dictionary: A python dictionary of name=>desc long_dict: A python dictionary of name=>(type, desc)

Parameters `return_as` – {table,tab,list,dictionary,long_dict,id_dict}

Returns A list or dictionary

1.6 grasp.ref

ref.py holds some simple lookups and the *PopFlags* classes that don't really go anywhere else. Holds reference objects for use elsewhere in the module.

class `grasp.ref.PopFlag`

Bases: `flags.Flags`

A simplified bitwise flag system for tracking populations.

CONSOLE SCRIPT

A Simple GRASP (grasp.nhlbi.nih.gov) API based on SQLAlchemy and Pandas

Author	Michael D Dacre < mike.dacre@gmail.com >
Organization	Stanford University
License	MIT License, use as you wish
Created	2016-10-08
Version	0.2.0b

Last modified: 2016-10-16 23:54

This is the front-end to a python grasp api, intended to allow easy database creation and simple querying. For most of the functions of this module, you will need to call the module directly.

```
usage: grasp [-h] {search,conf,info,init} ...
```

Sub-commands:

search (s, lookup) Query database for variants by location or id

Query for SNPs in the database. By default returns a tab-delimited list of SNPs with the following columns: 'id', 'snpid', 'study_snpid', 'chrom', 'pos', 'phenotype', 'pval'

The `--extra` flag adds these columns: 'InGene', 'InMiRNA', 'inLincRNA', 'LSSNP'

The `--study-info` flag adds these columns: 'study_id (PMID)', 'title'

The `--db-snp` flag uses the myvariant API to pull additional data from db_snp.

```
usage: grasp search [-h] [--extra] [--study-info] [--db-snp] [--pandas] [-o]
                        [--path]
                        query
```

Positional arguments:

query rsID, chrom:loc or chrom:start-end

Options:

--extra Add some extra columns to output

--study-info Include study title and PMID

--db-snp Add dbSNP info to output

--pandas Write output as a pandas dataframe

-o, --out File to write to, default STDOUT.

--path PATH to write files to

conf (config) Manage local config

```
usage: grasp conf [-h]
                  [--db {sqlite,postgresql,mysql} | --get-path | --set-path_
                  ↪PATH | --init]
```

Options:

--db	Set the current database platform. Possible choices: sqlite, postgresql, mysql
--get-path	Change the sqlite file path
--set-path	Change the sqlite file path
--init	Initialize the config with default settings. Will ERASE your old config!

info Display database info

Write data summaries (also found on the wiki) to a file or the console.

Choices: all: Will write everything to separate rst files, ignores all other flags except ‘-path’ phenotypes: All primary phenotypes. phenotype_categories: All phenotype categories. populations: All primary populations. population_flags: All population flags. snp_columns: All SNP columns. study_columns: All Study columns.

```
usage: grasp info [-h] [-o] [--path]
                  {study_columns,populations,phenotype_categories,population_
                  ↪flags,phenotypes,all,snp_columns}
```

Positional arguments:

display	Choice of item to display, if all, results are written to independant rst files, and optional args are ignored Possible choices: study_columns, populations, phenotype_categories, population_flags, phenotypes, all, snp_columns
----------------	--

Options:

-o, --out	File to write to, default STDOUT.
--path	PATH to write files to

init Initialize the database

```
usage: grasp init [-h] [-n] study_file grasp_file
```

Positional arguments:

study_file	GRASP study file from: github.com/MikeDacre/grasp/blob/master/grasp2_studies.txt
grasp_file	GRASP tab delimited file

Options:

-n, --no-progress	Do not display a progress bar
--------------------------	-------------------------------
