Basic Usage

This module contains a Python 3 API to work with the GRASP database. The database must be downloaded and initialized locally. The default is to use an sqlite backend, but postgresql or mysql may be used also; these two are slower to initialize (longer write times), but they may be faster on indexed reads.

The GRASP project is a SNP-level index of over 2000 GWAS datasets. It is very useful, but difficult to batch query as study descriptions are heterogenous and there are more than 9 million rows. By putting this information into a relational database, it is easy to pull out bite-sized chunks of data to analyze with pandas.

Commonly queried columns are indexed within the database for fast retrieval. A typical query for a single phenotype category returns several million SNPs in about 10 seconds, which can then be analyzed with pandas.

To read more about GRASP, visit the official page.

For reference information (e.g. column, population, and phenotype lists) see the wiki.

For complete API documentation, go to the documentation site

Contents

- Basic Usage
 - Installation
 - Usage
 - * Tables
 - * Querying
 - Example Workflow
 - ToDo

1.1 Installation

Use the standard installation procedure:

```
git clone https://github.com/MikeDacre/grasp.git
cd grasp
python ./setup.py install --user
```

This code requires a grasp database. Currently sqlite/postgesql/mysql are supported. Mysql and postgresql can be remote (but must be set up with this tool), sqlite is local.

Database configuration is stored in a config file that lives by default in ~/.grasp. This path is set in *config.py* and can be changed there is needed.

A script, *grasp*, is provided in *bin* and should automatically be installed to your *PATH*. It contains functions to set up your database config and to initialize the grasp database easily, making the initial steps trivial.

To set up your database configuration, run:

```
grasp config --init
```

This will prompt you for your database config options and create a file at ~/.grasp with those options saved.

You can now initialize the grasp database:

```
grasp init study_file grasp_file
```

The study file is available in this repository (grasp2_studies.txt.gz) It is just a copy of the official GRASP List of Studies converted to text and with an additional index that provides a numeric index for the non pubmed indexed studies.

Both files can be gzipped or bzipped.

The grasp file is the raw unzipped file from the project page: GRASP2fullDataset

The database takes about 90 minutes to build on a desktop machine and uses about 3GB of space. The majority of the build time is spent parsing dates, but because the dates are encoded in the SNP table, and the formatting varies, this step is required.

1.2 Usage

The code is based on SQLAlchemy, so you should read their ORM Query tutorial to know how to use this well.

It is important to note that the point of this software is to make bulk data access from the GRASP DB easy, SQLAlchemy makes this very easy indeed. However, to do complex comparisons, SQLAlchemy is very slow. As such, the best way to use this software is to use SQLAlchemy functions to bulk retrieve study lists, and then to directly get a pandas dataframe of SNPs from those lists.

Tables are defined in *grasp.tables* Database setup functions are in *grasp.db* Query tools for easy data manipulation are in *grasp.query*.

1.2.1 Tables

This module provides 6 tables:

Study, Phenotype, PhenoCats, Platform, Population, and SNP (as well as several association tables)

1.2.2 Querying

The functions in *grasp.query* are very helpful in automating common queries.

The simplest way to get a dataframe from SQLAlchemy is like this:

```
df = pandas.read_sql(session.query(SNP).statement)
```

Note that if you use this exact query, the dataframe will be too big to be useful. To get a much more useful dataframe:

```
studies = grasp.query.get_studies(pheno_cats='t2d', primary_pop='European')
df = grasp.query.get_snps(studies)
```

It is important to note that there are **three** ways of getting phenotype information: - The Phenotype table, which lists the primary phenotype for every study - The PhenoCats table, which lists the GRASP curated phenotype categories,

each Study has several of these.

• The phenotype_desc column in the SNP table, this is a poorly curated column directly from the full dataset, it roughly corresponds to the information in the Phenotype table, but the correspondance is not exact due to an abundance of typos and slightly differently typed information.

1.3 Example Workflow

```
from grasp import db
from grasp import tables as t
from grasp import query as q
s, e = db.get_session()
# Print a list of all phenotypes (also use with populations, but not with SNPs (too.
→many to display))
s.query(t.Phenotype).all()
# Filter the list
s.query(t.Phenotype).filter(t.Phenotype.phenotype.like('%diabetes%').all()
# Get a dictionary of studies to review
eur_t2d = get_studies(only_disc_pop='eur', primary_phenotype='Type II Diabetes_
→Mellitus', dictionary=True)
# Filter those by using eur.pop() to remove unwanted studies, and then get the SNPs_
→as a dataframe
eur_snps_df = get_snps(eur, pandas=True)
# Do the same thing for the african population
afr_t2d = get_studies(only_disc_pop='afr', primary_phenotype='Type II Diabetes_
→Mellitus', dictionary=True)
afr.pop('Use of diverse electronic medical record systems to identify genetic risk_
→for type 2 diabetes within a genome-wide association study.')
afr_snps_df = get_snps(afr, pandas=True)
# Collapse the matrices (take median of pvalue) and filter by resulting pvalue
eur_snps_df = q.collapse_dataframe(eur_snps_df, mechanism='median', pvalue_filter=5e-
afr_snps_df = q.collapse_dataframe(afr_snps_df, mechanism='median', pvalue_filter=5e-
⇔8)
# The new dataframes are indexed by 'chr:pos'
# Plot the overlapping SNPs
snps = q.intersect_overlapping_series(eur_snps_df.pval_median, afr_snps_df.pval_
→median)
snps.plot()
```

1.4 ToDo

• Add more functions to grasp script, including lookup by position or range of positions

GRASP Console Script

A Simple GRASP (grasp.nhlbi.nih.gov) API based on SQLAlchemy and Pandas

Author	Michael D Dacre <mike.dacre@gmail.com></mike.dacre@gmail.com>
Organization	Stanford University
License	MIT License, use as you wish
Created	2016-10-08
Version	0.3.0b1

Last modified: 2016-10-17 00:18

This is the front-end to a python grasp api, intended to allow easy database creation and simple querying. For most of the functions of this module, you will need to call the module directly.

```
usage: grasp [-h] {search,conf,info,init} ...
```

Sub-commands:

search (s, lookup) Query database for variants by location or id

Query for SNPs in the database. By default returns a tab-delimeted list of SNPs with the following columns: 'id', 'snpid', 'study_snpid', 'chrom', 'pos', 'phenotype', 'pval'

The -extra flag adds these columns: 'InGene', 'InMiRNA', 'inLincRNa', 'LSSNP'

The -study-info flag adds these columns: 'study_id (PMID)', 'title'

The –db-snp flag uses the myvariant API to pull additional data from db_snp.

Positional arguments:

query rsID, chrom:loc or chrom:start-end

Options:

--extra Add some extra columns to output
 --study-info Include study title and PMID
 --db-snp Add dbSNP info to output
 --pandas Write output as a pandas dataframe
 -o, --out File to write to, default STDOUT.

--path

PATH to write files to

conf (config) Manage local config

Options:

--db Set the current database platform.

Possible choices: sqlite, postgresql, mysql

--get-path Change the sqlite file path--set-path Change the sqlite file path

--init Initialize the config with default settings. Will ERASE your old

config!

info Display database info

Write data summaries (also found on the wiki) to a file or the console.

Choices: all: Will write everything to separate rst files, ignores all other flags except '-path' phenotypes: All primary phenotypes. Phenotype_categories: All phenotype categories. populations: All primary populations. population_flags: All population flags. snp_columns: All SNP columns. study_columns: All Study columns.

Positional arguments:

display Choice of item to display, if all, results are written to independent

rst files, and optional args are ignored

Possible choices: populations, population_flags, snp_columns,

all, study_columns, phenotype_categories, phenotypes

Options:

-0, --out File to write to, default STDOUT.

--path PATH to write files to

init Initialize the database

```
usage: grasp init [-h] [-n] study_file grasp_file
```

Positional arguments:

study_file GRASP study file from: github.com/MikeDacre/grasp/blob/master/grasp2_studies.txt

grasp_file GRASP tab delimeted file

Options:

-n, --no-progress Do not display a progress bar

Library (API Documentation)

This code is intended to be primarily used as a library, and works best when used in an interactive python session (e.g. with jupyter) alongside pandas. Many of the query functions in this library returns pandas dataframes.

Below is a complete documentation of the API for this library. The functions in *grasp.query* will be the most interesting for most users wanting to do common db queries.

Tables are defined in *grasp.tables*, functions for connecting to and building the database are in *grasp.db. grasp.info* contains simple documentation for all of the tables and phenotypes (used to build this documentation).

grasp.config handles the static database configuration at ~/.grasp, and grasp.ref is used to define module wide static objects, like dictionaries and the PopFlags class.

3.1 grasp.query

A mix of functions to make querying the database and analyzing the results faster.

Primary query functions:

get studies(): Allows querying the Study table by a combination of population and phenotype variables.

get_snps(): Take a study list (possibly from get_studies) and return a SNP list or dataframe.

Helpful addional functions:

intersecting_phenos(): Return a list of phenotypes or phenotype categories present in all queried populations.

Lookup functions:

<code>lookup_rsid()</code> and <code>lookup_location()</code> allow the querying of the database for specific SNPs and can return customized information on them.

MyVariant:

get_variant_info(): Use myvariant to get variant info for a list of SNPs.

DataFrame Manipulation:

collapse_dataframe(): Collapse a dataframe (such as that returned by $get_snps()$) to include only a single entry per SNP (collapsing multiple studies into one).

```
3.1.1 get studies
```

3.1.2 get snps

3.1.3 get_variant_info

3.1.4 get collapse dataframe

3.1.5 intersect_overlapping_series

3.2 grasp.tables

GRASP table descriptions in SQLAlchemy ORM.

These tables do not exist in the GRASP data, which is a single flat file. By separating the data into these tables querying is much more efficient.

This submodule should only be used for querying.

```
class grasp.tables.SNP (**kwargs)
```

Bases: sqlalchemy.ext.declarative.api.Base

An SQLAlchemy Talble for GRASP SNPs.

Study and phenotype information are pushed to other tables to minimize table size and make querying easier.

Table Name: snps

Columns: Described in the columns attribute

int

The ID number of the SNP, usually the NHLBIkey

str

SNP loction expressed as 'chr:pos'

hvgs_ids

A list of HGVS IDs for this SNP

columns

A dictionary of all columns 'column_name'=>('type', 'desc')

columns = OrderedDict([('id', ('BigInteger', 'NHLBIkey')), ('snpid', ('String', 'SNPid')), ('chrom', ('String', 'chr')), ('partial columns in this table.

```
display_columns (display_as='table', write=False)
```

Return all columns in the table nicely formatted.

Display choices: table: A formatted grid-like table tab: A tab delimited non-formatted version of table list: A string list of column names

Parameters

- display_as {table,tab,list}
- write If true, print output to console, otherwise return string.

Returns A formatted string or None

```
get_columns (return_as='list')
```

Return all columns in the table nicely formatted.

Display choices: list: A python list of column names dictionary: A python dictionary of name=>desc long_dict: A python dictionary of name=>(type, desc)

Parameters return_as - {table,tab,list,dictionary,long_dict,id_dict}

Returns A list or dictionary

```
get_variant_info (fields='dbsnp', pandas=True)
```

Use the myvariant API to get info about this SNP.

Note that this service can be very slow. It will be faster to query multiple SNPs.

Parameters

- fields Choose fields to display from: 'docs.myvariant.info/en/latest/doc/data.html#available-fields'_ Good choices are 'dbsnp', 'clinvar', or 'gwassnps' Can also use 'grasp' to get a different version of this info.
- pandas Return a dataframe instead of dictionary.

Returns A dictionary or a dataframe.

hvgs_ids

The HVGS ID from myvariant.

snp_loc

Return a simple string containing the SNP location.

```
class grasp.tables.Phenotype (**kwargs)
```

Bases: sqlalchemy.ext.declarative.api.Base

An SQLAlchemy table to store the primary phenotype.

Table Name: phenos

Columns: phenotype: The string phenotype from the GRASP DB, unique. alias: A short representation of the phenotype, not unique. studies: A link to the studies table.

int

The ID number.

str

The name of the phenotype.

```
class grasp.tables.PhenoCats(**kwargs)
```

Bases: sqlalchemy.ext.declarative.api.Base

An SQLAlchemy table to store the lists of phenotype categories.

Table Name: pheno cats

Columns: category: The category from the grasp database, unique. alias: An easy to use alias of the category, not unique. snps: A link to all SNPs in this category. studies: A link to all studies in this category.

int

The PhenoCat ID

str

The category name

class grasp.tables.Platform(platform)

Bases: sqlalchemy.ext.declarative.api.Base

An SQLAlchemy table to store the platform information.

3.2. grasp.tables

Table Name: platforms

Columns: platform: The name of the platform from GRASP. studies: A link to all studies using this platform.

int

The ID number of this platform

str

The name of the platform

class grasp.tables.Population (population)

Bases: sqlalchemy.ext.declarative.api.Base

An SQLAlchemy table to store the platform information.

Table Name: populations

Columns: population: The name of the population. studies: A link to all studies in this population. snps: A link to all SNPs in this populations.

int

Population ID number

str

The name of the population

3.3 grasp.db

Functions for managing the GRASP database.

get_session() is used everywhere in the module to create a connection to the database. initialize_database() is used to build the database from the GRASP file. It takes about an hour 90 minutes to run and will overwrite any existing database.

grasp.db.get_session(echo=False)

Return a session and engine, uses config file.

Parameters echo – Echo all SQL to the console.

Returns

A SQLAlchemy session and engine object corresponding to the grasp database for use in querying.

Return type session, engine

grasp.db.initialize_database (study_file, grasp_file, commit_every=250000, progress=False) Create the database quickly.

Study_file Tab delimited GRASP study file, available here: github.com/MikeDacre/grasp/blob/master/grasp_studies.txt

Grasp_file Tab delimited GRASP file.

Commit_every How many rows to go through before committing to disk.

Progress Display a progress bar (db length hard coded).

3.4 grasp.config

```
Manage a persistent configuration for the database.
```

```
grasp.config.config = <configParser.ConfigParser object>
    A globally accessible ConfigParger object, initialized with CONFIG_FILE.

grasp.config.CONFIG_FILE = '/Users/dacre/.grasp'
    The PATH to the config file.

grasp.config.init_config(db_type, db_file='', db_host='', db_user='', db_pass='')
    Create an initial config file.
```

Parameters

- db_type 'sqlite/mysql/postgresql'
- db_file PATH to sqlite database file
- **db_host** Hostname for mysql or postgresql server
- **db_user** Username for mysql or postgresql server
- **db_pass** Password for mysql or postgresql server (not secure)

Returns NoneType

Return type None

```
{\tt grasp.config.init\_config\_interactive()}
```

Interact with the user to create a new config.

Uses readline autocompletion to make setup easier.

```
grasp.config.write_config()
```

Write the current config to CONFIG_FILE.

3.5 grasp.info

Little functions to pretty print column lists and category info.

get_{phenotypes,phenotype_categories,popululations} all display a dump of the whole database.

get_population_flags displays available flags from PopFlag.

display_{study,snp}_columns displays a list of available columns in those two tables as a formatted string.

get_{study,snp}_columns return a list of available columns in those two tables as python objects.

```
grasp.info.display_snp_columns (display_as='table', write=False)
```

Return all columns in the SNP table as a string.

Display choices: table: A formatted grid-like table tab: A tab delimited non-formatted version of table list: A string list of column names

Parameters

- display_as {table,tab,list}
- write If true, print output to console, otherwise return string.

Returns A formatted string or None

3.4. grasp.config

grasp.info.display_study_columns (display_as='table', write=False)

Return all columns in the Study table as a string.

Display choices: table: A formatted grid-like table tab: A tab delimited non-formatted version of table list: A string list of column names

Parameters

- display_as {table,tab,list}
- write If true, print output to console, otherwise return string.

Returns A formatted string or None

 $\verb|grasp.info.get_phenotype_categories| (\textit{list_only=False}, \textit{dictionary=False}, \textit{table=False})|$

Return all phenotype categories from the PhenoCats table.

List_only Return a simple text list instead of a list of Phenotype objects.

Dictionary Return a dictionary of phenotype=>ID

Table Return a pretty table for printing.

grasp.info.get_phenotypes (list_only=False, dictionary=False, table=False)

Return all phenotypes from the Phenotype table.

List_only Return a simple text list instead of a list of Phenotype objects.

Dictionary Return a dictionary of phenotype=>ID

Table Return a pretty table for printing.

grasp.info.get_population_flags(list_only=False, dictionary=False, table=False)

Return all population flags available in the PopFlags class.

List_only Return a simple text list instead of a list of Phenotype objects.

Dictionary Return a dictionary of population=>ID

Table Return a pretty table for printing.

grasp.info.get_populations (list_only=False, dictionary=False, table=False)

Return all populations from the Population table.

List_only Return a simple text list instead of a list of Phenotype objects.

Dictionary Return a dictionary of population=>ID

Table Return a pretty table for printing.

grasp.info.get snp columns(return as='list')

Return all columns in the SNP table.

Display choices: list: A python list of column names dictionary: A python dictionary of name=>desc long_dict: A python dictionary of name=>(type, desc)

Parameters return_as - {table,tab,list,dictionary,long_dict,id_dict}

Returns A list or dictionary

grasp.info.get_study_columns(return_as='list')

Return all columns in the SNP table.

Display choices: list: A python list of column names dictionary: A python dictionary of name=>desc long_dict: A python dictionary of name=>(type, desc)

Parameters return_as - {table,tab,list,dictionary,long_dict,id_dict}
Returns A list or dictionary

3.6 grasp.ref

ref.py holds some simple lookups and the *PopFlags* classes that don't really go anywhere else. Holds reference objects for use elsewhere in the module.

class grasp.ref.PopFlag
 Bases: flags.Flags

A simplified bitwise flag system for tracking populations.

3.6. grasp.ref 15

Table Columns

The two important tables with the majority of the data are Study and SNP. In addition, phenotype data is stored in Phenotype and PhenoCats, population data is in Population, and platforms are in Platform.

Contents

- Table Columns
 - Study
 - SNP
 - Phenotype
 - PhenoCats
 - Population
 - Platform

4.1 Study

To query studies, it is recommended to use the query.get_studies() function.

Column	Description	Type
id	id	Integer
pmid	PubmedID	String
title	Study	String
journal	Journal	String
author	1st_author	String
grasp_ver	GRASPversion?	Integer

String	rep_pop_flag	A bitwise flag that shows presence/absence of replication populations	Integer
rep_east_asian	rep_european	European.1	Integer
rep_south_asian Indian/South Asian.1 Integer rep_hispanic Hispanic.1 Integer rep_native Native.1 Integer rep_micronesian Micronesian.1 Integer rep_arab Arab/ME.1 Integer rep_mixed Mixed.1 Integer rep_unpecified Unspec.1 Integer rep_filipino Filipino.1 Integer rep_indonesian Indonesian.1 Integer rep_indonesian Indonesian.1 Integer rep_sample_size Initial Sample Size, string description of integer population counts above. String	rep_african	African ancestry.1	Integer
rep_hispanic Hispanic.1 Integer rep_native Native.1 Integer rep_micronesian Micronesian.1 Integer rep_arab Arab/ME.1 Integer rep_mixed Mixed.1 Integer rep_unpecified Unspec.1 Integer rep_filipino Filipino.1 Integer rep_indonesian Indonesian.1 Integer rep_sample_size Initial Sample Size, string description of integer population counts above. String	rep_east_asian	East Asian.1	Integer
rep_native Native.1 Integer rep_micronesian Micronesian.1 Integer rep_arab Arab/ME.1 Integer rep_mixed Mixed.1 Integer rep_unpecified Unspec.1 Integer rep_filipino Filipino.1 Integer rep_indonesian Indonesian.1 Integer rep_sample_size Initial Sample Size, string description of integer population counts above. String	rep_south_asian	Indian/South Asian.1	Integer
rep_micronesian Micronesian.1 Integer rep_arab Arab/ME.1 Integer rep_mixed Mixed.1 Integer rep_unpecified Unspec.1 Integer rep_filipino Filipino.1 Integer rep_indonesian Indonesian.1 Integer rep_sample_size Initial Sample Size, string description of integer population counts above. String	rep_hispanic	Hispanic.1	Integer
rep_arab Arab/ME.1 Integer rep_mixed Mixed.1 Integer rep_unpecified Unspec.1 Integer rep_filipino Filipino.1 Integer rep_indonesian Indonesian.1 Integer rep_sample_size Initial Sample Size, string description of integer population counts above. String	rep_native	Native.1	Integer
rep_arab Arab/ME.1 Integer rep_mixed Mixed.1 Integer rep_unpecified Unspec.1 Integer rep_filipino Filipino.1 Integer rep_indonesian Indonesian.1 Integer rep_sample_size Initial Sample Size, string description of integer population counts above. String	rep_micronesian	Micronesian.1	Integer
rep_unpecified Unspec.1 Integer rep_filipino Filipino.1 Integer rep_indonesian Indonesian.1 Integer sample_size Initial Sample Size, string description of integer population counts above. String	rep_arab	Arab/ME.1	Integer
rep_unpecified Unspec.1 Integer rep_filipino Filipino.1 Integer rep_indonesian Indonesian.1 Integer sample_size Initial Sample Size, string description of integer population counts above. String	rep_mixed	Mixed.1	_
rep_filipino Filipino.1 Integer rep_indonesian Indonesian.1 Integer sample_size Initial Sample Size, string description of integer population counts above. String	rep_unpecified	Unspec.1	
rep_indonesian Indonesian.1 Integer sample_size Initial Sample Size, string description of integer population counts above. String	rep_filipino		
sample_size	rep_indonesian		
	sample_size	Initial Sample Size, string description of integer population counts above.	_
	replication_size		

4.2 SNP

Column	Description	Type
id	NHLBIkey	BigInteger
snpid	SNPid	String
chrom	chr	String
	Continu	ed on next page

Table 4.2 – continued from previous page

Column	Description	Туре
pos	pos	Integer
pval	Pvalue	Float
NHLBIkey	NHLBIkey	String
HUPfield	HUPfield	String
LastCurationDate	LastCurationDate	Date
CreationDate	CreationDate	Date
population_id	Primary	Integer
population	Link	relationship
study_id	Primary	Integer
study	Link	relationship
study_snpid	SNPid	String
paper_loc	LocationWithinPaper	String
phenotype_desc	Phenotype	String
phenotype_cats	Link	relationship
InGene	InGene	String
NearestGene	NearestGene	String
InLincRNA	InLincRNA	String
InMiRNA	InMiRNA	String
InMiRNABS	InMiRNABS	String
dbSNPfxn	dbSNPfxn	String
dbSNPMAF	dbSNPMAF	String
dbSNPinfo	dbSNPalleles	String
dbSNPvalidation	dbSNPvalidation	String
dbSNPClinStatus	dbSNPClinStatus	String
ORegAnno	ORegAnno	String
ConservPredTFBS	ConservPredTFBS	String
HumanEnhancer	HumanEnhancer	String
RNAedit	RNAedit	String
PolyPhen2	PolyPhen2	String
SIFT	SIFT	String
LSSNP	LS	String
UniProt	UniProt	String
EqtlMethMetabStudy	EqtlMethMetabStudy	String

4.3 Phenotype

All available phenotypes are available on the Phenotypes wiki page

- id
- phenotype
- studies (link to Study table)
- snps (link to SNP table)

4.4 PhenoCats

All phenotype categories are available on the Phenotype Categories wiki page

4.3. Phenotype

- id
- population
- alias
- studies (link to Study table)
- snps (link to SNP table)

4.5 Population

- id
- population
- studies (link to Study table)
- snps (link to SNP table)

All population entries are available on the Populations wiki page

4.6 Platform

- id
- platform
- studies (link to Study table)
- snps (link to SNP table)
